LESSON 07 · MISSION GUIDE

The Armoury

Modules, the standard library, virtual environments and pip: using code you didn't write.

From **Orrin of the Clockworks**
To **Jen, Keeper of the Guild Ledger**
By **Raven (it's about your spells)**

Keeper. I had a look at your `my_work` folders. Lovely stuff. Also: `loot_share()` appears in eleven files, three of them slightly different. When Pell changes the leader's share, you'll fix it eleven times and miss one. I've seen this tale before. Dalvric was in it.

Today: forge your functions into a module and import them. Visit the standard library, an armoury built by people with more patience than either of us. Then `pip`, which brings in weapons other smiths made, inside a virtual environment, so nothing you install can break your machine or my rest day. Next time it brings NumPy and pandas, and the Grimoire gets nervous. — Orrin

What you'll be able to do after today

- [ ] Create and activate a virtual environment, and explain to the Queen what it's for in one sentence
- [ ] Install packages from a `requirements.txt` with `pip`, and check what's installed
- [ ] Use `import` three ways: `import math`, `from datetime import date`, `import questkit`
- [ ] Borrow from the standard library: `math`, `statistics`, `datetime`, `random`
- [ ] Put your own functions in a module and import them from another file
- [ ] Use `if __name__ == "__main__":` so a module is quiet when imported, chatty when run

Four big ideas

1. A module is a file	`questkit.py` is the module `questkit`. `import questkit` runs the file once and gives you its functions as `questkit.share()`.
2. The standard library is already installed	`math`, `statistics`, `datetime`, `random`, `csv`, `pathlib` … no pip needed. `help(module)` in the REPL is the manual.
3. pip installs everything else	Hundreds of thousands of packages on PyPI. `pip install rich` downloads, installs, and makes `import rich` work.
4. A venv is an armoury per project	Packages installed with the venv active go into `.venv/`, not into Windows. Delete the folder, and it's as if nothing happened.

Three things that bite

- Forgetting to activate. "No module named rich" usually means the venv is asleep. Look for `(.venv)` in the prompt.
- A file called `random.py` (or `csv.py`, `math.py`) in `my_work/` hides the real module.
- Committing `.venv/`: thousands of files that belong to your laptop. `.gitignore` hides it; check `git status`.

Why this matters at work

- **Don't write what exists.** Dates, statistics, Excel files, charts: somebody has done it, tested it and documented it. Plug it in.
- **One function, one place.** A module is the difference between "fix it once" and "find all eleven copies".
- **Reproducible setup.** `requirements.txt` + a venv: the same armoury on any machine in two commands. No "works in Dalvric's tower".

How today works

15 MIN
Lecture
Lars makes a venv, installs a package, writes a module, live

60 MIN
Exercise sheet
Seven ravens, from your own armoury to a package you've never seen

15 MIN
Grimoire, page 7
Dalvric's party planner, from the week he discovered import

The ravens

#	FROM	RAVEN	YOU'LL USE
1	Orrin	An armoury of your own	`python -m venv`, `activate`, `pip install -r`
2	The Queen	Borrow from the standard library	`math.ceil`, `statistics.mean/median/stdev`
3	Pell	Dates without tears	`date`, `timedelta`, `strftime` codes
4	Orrin	Your own module	`questkit.py`, `import questkit`, docstrings
5	Siv	Biscuit's raffle	`random.seed/choice/sample/shuffle`
6	The Queen	Something you didn't write	`rich`, reading docs
7 ⭐	Orrin	The main guard	`if __name__ == "__main__":`

You're done when...

- [ ] Your prompt shows `(.venv)` and `pip list` shows `rich`
- [ ] `my_work/` has `questkit.py` and `ex2` to `ex6` (and `ex7`), each printing the expected output
- [ ] Dalvric's planner prints the four expected lines, one commit per bug
- [ ] Everything is pushed to `lesson-07`, `.venv/` is not, and you've opened a pull request

Next lesson: A Thousand Arrows at Once. Your first `pip install numpy`. Instead of looping over 400 quests, you'll do the maths on the whole column in one line, the way you drag a formula down in Excel, except it's instant and never off by a row.
